FPE+ Fermented Plant Extracts

GROWER PRODUCT GUIDE

Living-Soil Probiotics & Biostimulants for Commercial Growers

Powered by Pursanova Activated Water Technology • Inspired by Korean Natural Farming

WHAT IS FPE+?

FPE+ is Teshuva Ag's enhanced line of fermented plant extracts. Like a probiotic for soil, FPE+ helps feed and support beneficial microbial populations in the root zone. Each FPE+ is produced by lacto-fermenting fresh plant material sourced exclusively from naturally, regeneratively farmed crops, using our enhanced fermentation process powered by **Pursanova Activated Water Technology**. This process cleans and restores water to its natural frequency using physics — without chemicals, magnets, or electronic devices — creating an environment for stronger, uninhibited microbes.

THE SCIENCE: WHY FERMENTATION WORKS

Fermentation is the key step that makes FPE+ so useful. It breaks down complex plant compounds into simpler forms that are more readily utilized by soil biology and crops. Scientific reviews of fermented plant extracts describe how beneficial bacteria and yeasts transform plant material into biologically active, available compounds that support nutrient cycling and plant health.

What Fermentation Unlocks

- Polyphenols and flavonoids — plant compounds linked to antioxidant activity and natural defense.
- Organic acids and amino acids — simple building blocks plants and microbes use for growth.
- Enzymes and proteins — biological tools that speed up nutrient cycling in the soil.
- Beneficial microbes — the living bacteria and fungi that colonize the root zone.

Researchers note that fermented plant materials show greater biological activity and bioavailability than the same plants left unfermented. In plain terms: fermentation takes nutrients that were locked inside plant tissue and turns them into a form that soil life and crops can actually use.

ROOTED IN KOREAN NATURAL FARMING (KNF)

FPE+ products are inspired by Korean Natural Farming, developed by Master Han-Kyu Cho. Each is a crude hybrid of **LAB** (Lactic Acid Bacteria) and **FPJ** (Fermented Plant Juice) or **FFJ** (Fermented Fruit Juice). KNF builds soil health using natural inputs instead of relying on synthetic chemicals. Its core inputs include indigenous (locally collected) microorganisms, fermented plant and fruit products, and lactic acid bacteria.

The idea behind KNF is simple: when plants receive complete, balanced nutrition from a living soil, they grow strong enough to resist pests, disease, and mold on their own. By feeding the soil instead of just the plant, KNF growers reduce their need for pesticides and chemical fixes — and their crops can keep thriving even when weather and field conditions are tough.

SOIL & CROP BENEFITS

- Boosts the diversity and population of beneficial soil microbes.
- Increases nutrient availability and nutrient density in the root zone.
- Supports stronger root development and overall plant health.
- Improves crop quality and productivity.
- Enhances fragrance, flavor, and color in fruits, flowers, and produce.
- Speeds the breakdown of organic matter into plant-ready food.
- Accelerates compost breakdown when added to your pile.

> **Lactic Acid Bacteria — the "KNF Police"** — is an effective fungicide replacement in a regenerative system. We've used FPE+ as a bloom spray in almonds, cherries, peaches, blueberries, apples, quince, and jujubes with **crop-protection results identical to a chemical fungicide** — without handling hazardous materials. FPE+ is a net positive to your overall farm biome, on both a macro and micro scale.

Application Rates

Application Method	Rate
Foliar Spray	1 qt – 1 gal per acre
Drip / Irrigation Injection / Soil Drench	1 qt – 1 gal per acre

FPE+ Pricing

Volume	Price
Tote	$10 / gal
2.5 gal jug / 5 gal bucket	$16 / gal

TESHUVA AG FPE+ PRODUCT LINE

Teshuva Ag FPE+ products are produced from seasonally available plant materials. Availability may change throughout the year based on seasonality and quality.

Product	Primary Characteristics
FPE+ Alfalfa	Growth-promoting compounds and plant nutrients.
FPE+ Nettle	Supports plant vigor and nutrient cycling.
FPE+ Plantain	Traditionally used for overall plant health.

Product	Primary Characteristics
FPE+ Bamboo	Naturally occurring silica and structural-support compounds.
FPE+ Lambsquarter	Broad-spectrum plant-derived nutrients and compounds.
FPE+ Pomegranate	Polyphenols and antioxidant compounds.
FPE+ Fermented Sea Water	Naturally rich in trace minerals and marine-derived compounds that support nutrient balance, microbial activity, and overall crop resilience.

Seasonal Availability: *Additional FPE+ products may be introduced throughout the year as suitable plant materials become available.*

FPE+ Fermented Sea Water + WCA. FPE+ Fermented Sea Water can be used in tandem with WCA (Water-Soluble Calcium) to promote ripening and firmness, increase BRIX, improve taste and smell, and increase nutrient density. This teaching from Master Cho aligns with the concept of calcium as the "Queen of Nutrients": calcium improves the plant's ability to direct and utilize the micronutrients the sea water provides. The biological function also plays a key role, providing effective disease suppression while delivering its main function of ripening the crop.

Custom FPE+ — A Service We Offer

We also produce custom FPE+. For example, the alfalfa field we harvest to make FPE+ Alfalfa receives an application of the product after every cutting of hay — so the product improves as the crop improves, creating a circular pattern of soil and plant health. We offer this as a service when the plant material is brought to us.

Sourcing Commitment. All Teshuva Ag FPE+ products are produced from plant materials sourced from naturally, regeneratively farmed crops. Produced on-site in Hanford, CA by Teshuva Ag, powered by Pursanova Activated Water Technology.

ORDER & INFORMATION

To order FPE+, request custom blends, or build a program for your operation, contact Teshuva Ag directly using the information below.
